My Dream Job

I want to be a computer programmer when I grow up. Computer programmers need to write and test codes for new programs, update existing programs, identify and correct coding errors. They usually work in offices. They normally don't work at home. They usually work shifts in case of an emergency. Sometimes they need to work overtime. Computer programmers do not wear uniforms. Some of them wear suits in offices. Some of them may wear smart casual outfits. It depends on the type of company you work for. The average salary of a computer programmer is HK$23,833 per month.

I want to be a computer programmer when I grow up because I like robots. I have always been interested in new robots that make our lives a lot more convenient. For example, self-service kiosks, driverless cars and robot security guards. I loved watching videos about technology. I like watching people testing new gadgets. I think computer programmers need to be careful so that they won't make any coding mistakes. They need to be smart too so that they can understand why some of the codes are not working. I think my life will be very busy if I become a computer programmer.

It is not easy to become a computer programmer. I think I can be a computer programmer because I am a quick learner. I can learn how to code quickly and make my own programs.

I am going to work hard so that my dream can come true. I will get a place in a university and learn more about coding. I will try my hardest to learn more profound programming knowledge.

I hope one day I can be a computer programmer. Maybe one day my program will be famous.
